

ECSP3000 Weekly Meeting Report

Elliott Jelbert
Supervisor: BooJoong Kang

Week 2

What's Been Done:

- **Project Brief Submission** (Submitted): Submitted my Project Brief
- **Research** (On-Going): I have found various useful sources both on the evaluation of rootkit detectors (relatively modern), rootkit design evolution on Linux & rootkit detection.
- **Preliminary Design Of Framework** (On-Going) : I have made various early decisions about the architecture of my framework but still need to iron out specifics on rootkit loading and the 'adapters' for the detectors.

Challenges:

- I need to learn the various rootkit hooking methods - I have found various good resources online for this
- I need to figure out how to allow the developer to easily specify a way parse the results from their detector s.t the framework can understand its results

Questions:

- Is "a review of the background literature that pertains to your project" a background or literature review (for the progress report)?
- Should the engineering goal / product be a Research Question?
- Can we cite with IEEE standards instead of Harvard?
- What is the actual difference in terms of formality & information in our progress report and final report - especially when it comes to the background?

Next Actions:

- Begin thinking about completing the project plan document.
 - Decide on my preliminary prototype design to then do a feasibility test
 - Continue my research, perhaps conducting a formal literature review or at least producing the progress report lit review / background
-
