

ECSP3000 Project Brief

*Designing and Implementing an Automated & Reproducible
Testbed for Linux Rootkit Detectors, Aiming to Identify and
Implement a Novel Rootkit/Detector Technique*

1. Project Aims

A substantial amount of current research into the evaluation of rootkits and rootkit detectors rely on bespoke evaluation methods which cannot be robustly reproduced by third partys.

This tool aims to provide developers, researchers and sys-admins with an automated and reproducible testing framework for rootkits & rootkit detectors on the modern Linux kernel to foster future development and testing.

As a secondary aim I will use this tool to identify and evaluate current avenues in the modern (7.2) Linux Kernel for rootkit persistence and design, finishing with an evaluation using the aforementioned benchmarking tool.

2. Project Objectives

This project will have the following aims which will be used to gauge success:

3. Limitations & Scope

What are the things I will not be doing.

4. Technical & Development Approach

Brief overview of how I will approach this project both technically and research wise
